

SLIDE #17**1. Which KPI is the most important?**

The most important KPI really depends on what the business is trying to achieve. But in general, the KPI that is directly connected to revenue or profit is usually the most important because it shows if the business is actually making money. For example, if it is a retail business, total sales or net profit can be considered the most important KPI since they reflect the overall performance of the company.

2. Which KPI should management monitor daily?

Management should monitor operational KPIs daily. These are the numbers that can change quickly and may need immediate action. Examples are daily sales, number of customers served, website traffic, production output, or customer complaints. Checking these every day helps management spot problems early and make quick adjustments before they become bigger issues.

3. Which KPI should management monitor monthly?

Monthly monitoring is better for KPIs that show overall business performance and longer-term trends. Examples include monthly revenue, net profit, customer retention rate, employee turnover, and operating expenses. Looking at these every month gives management enough data to see patterns and evaluate if the business is moving toward its goals.

4. What decisions can be made using these KPIs?

KPIs help management make better business decisions. If sales are going down, management may decide to increase marketing efforts or offer promotions. If customer complaints are increasing, they may improve customer service or review product quality. If expenses are too high, they may look for ways to reduce costs. Basically, KPIs help management identify what is working and what needs improvement so decisions are based on actual data instead of guesswork.

5. What data is needed to calculate these KPIs?

The data needed depends on the KPI being measured. For sales KPIs, the company needs sales records and transaction data. For profit KPIs, revenue and expense data are required. Customer-related KPIs may need customer feedback, survey results, or purchase history. Employee KPIs often require attendance records, productivity reports, or HR data. In general, businesses need accurate and updated operational, financial, customer, and employee data to calculate KPIs properly and get reliable results.

SLIDE #20**1. Why are KPIs important?**

KPIs are important because they show if a company is doing well or not. They help management track progress and make decisions based on actual numbers instead of guessing.

2. Can a company operate without KPIs?

Yes, but it would be harder to manage. The company can still run, but it may not know what is working and what needs improvement.

3. What happens when organizations monitor the wrong KPIs?

They might focus on the wrong things and make bad decisions. Even if a KPI improves, it may not actually help the organization reach its goals.

4. What KPIs should a school monitor?

A school should monitor things like attendance rate, student grades, graduation rate, passing rate, and student satisfaction. These help show if students are learning and if the school is performing well.

SLIDE #21

1. What is the dashboard about?

The dashboard is about the performance of a Superstore business. It mainly shows sales, customers, promotions, and returns.

2. What are the KPIs shown?

The KPIs shown are sales, sales by region, sales by category, monthly sales, returns, and customer segments.

3. Which chart is most useful?

The Monthly Sales Trend chart is the most useful because it quickly shows if sales are going up or down.

4. Which chart is least useful?

The Customer Segments chart is probably the least useful since it does not directly show business performance compared to the sales charts.

5. Is the dashboard easy to understand?

Yes. The charts are organized well and the information is easy to follow.

6. What improvements can be made?

It could have KPI cards at the top for total sales, profit, and orders. The design can also be a bit cleaner.

7. What business decisions can be supported?

It can help decide which products to focus on, which regions perform best, and whether promotions are working or not.
